**RE: Letter of Attachment to the 2021 Currituck County Topographic and Hydrographic Data Acquisition Report.**

Dear Mr. Willson:

During the processing of the Currituck County sounding data from June 5, 2021 (methods of collection are described in the above referenced report) elevation errors were discovered at the depth of closure when compared to multiple historic data sets. The sound velocity curves and tidal data were analyzed but did not exhibit any obvious errors. Historic data collected with the same methods were used as a comparison to derive a sounding adjustment at depth. Hypack2020's Sound Velocity Sounding Adjustment tool was used to apply the adjustment derived from historical data as shown in the table below. The adjustment was only applied to sounding data from June 5, 2021 representing profiles CM-58 to CM-87.

To Depth (Feet)	Adjustment (Feet)
0	0
5	0
10	0
15	0.5
20	0.75
25	1.25
30	1.5
50	1.5

If you have any questions, please feel free to reach out to me at 561.248.2083 or

## ABSTRACT

Aptim Environmental and Infrastructure, LLC (APTIM) was contracted by Coastal Protection Engineering of North Carolina, Inc. to provide a topographic and hydrographic survey. The 2021 topographic and hydrographic survey consisted of one hundred twenty (120) profile stations spanning across Currituck County. APTIM surveyors conducted the beach and hydrographic surveys from June 01, 2021 through June 08, 2021.

The physical monitoring of Currituck County included topographic and hydrographic surveys of the beach and offshore areas. The monitoring data is necessary to observe and assess beach conditions for future construction. The scientific monitoring processes provide information necessary to plan, design, and optimize subsequent follow up projects. The information gathered may potentially reduce the need for, and cost of, unnecessary work as well as potentially reducing any environmental impacts that may have, or is expected to occur.

## SURVEY METHODOLOGIES

The surveys were conducted in accordance with the Minimum Performance Standards for the U.S. Army Corps of Engineers (USACE), Engineering and Design Hydrographic Surveying Manual (EM 1110-2-1003).

This survey is in accordance with Chapter 56.1606 of the North Carolina Administrative Code (NCAC) specifications established by The North Carolina Engineering and Land Surveying Act (GS89C). In addition, all hydrographic surveying was conducted under the direct supervision of an American Congress of Surveying and Mapping (ACSM) Certified Hydrographer (CH). Included in this Hydrographic and Topographic Survey Report are twenty-seven (27) maps visualizing profiles, one (1) project location map, one (1) control data sheet, and twenty-five (25) plan view maps. The plan view maps show reduced true position elevation data collected during the survey. The location of all published control, as well as control found and used for survey purposes, is presented in the Monument Information Report provided in **Appendix 1**.

Vertical data was collected in the North American Vertical Datum of 1988 (NAVD88), GEOID 18. All Horizontal data is provided in the North Carolina State Plane Coordinate System, North American Datum of 1983(2011) (NAD 83(2011)). Profile data is presented in xyz format relative to The North American Vertical Datum of 1988 (NAVD88) in **Appendix 2** (digital format only). Profile plots are provided in **Appendix 3**. Ground digital photography obtained during the survey is provided in **Appendix 4**. Copies of all field book pages are provided in **Appendix 5** (digital format only).

The field survey and data collection activities encompassed four (4) phases. Brief descriptions of each survey phase, including methodologies and quality control/quality assurance procedures, are described below.

### **Phase One: Control Reconnaissance/Establishment/Verification**

Prior to the start of the survey, reconnaissance of the monuments was conducted to confirm that survey control was in place and undisturbed. Real Time Kinematic Global Positioning System (RTK GPS) was used, along with RTK GPS within a virtual reference station (VRS) network, to locate and confirm survey control for this project. The North Carolina Geodetic Survey Continuously Operating Reference Station (CORS) Network stations used for this project included NCDU (Duck 3), NCCR (Creswell), NCEL (Elizabeth), LOY2 (Loyola 2), LOYZ (Loyola Z) and LS03 (Loyola LS03). The horizontal and vertical accuracy of control data meets the accuracy requirements as set forth in the Engineering and Design Hydrographic Surveying Manual (EM 1110-2-1003). In order to achieve required accuracy, the topographic and hydrographic surveys were controlled using 2<sup>nd</sup> order monuments, specifically CAFFEY,

RIDE, RUN, ADRIATIC, Q 261, and RADIO from the National Geodetic Survey (NGS). Horizontal and vertical positioning checks were conducted at the beginning and end of each day using at least two 2<sup>nd</sup> order monuments in the project area. The RTK GPS utilizes statistical methods to ensure accuracy of RTK GPS data remains within the 95% confidence interval. The control check shots were acquired using a minimum of five (5) epochs which results in a high accuracy location. Results from 2<sup>nd</sup> order control checks are displayed showing northing, easting, monument elevation, inverses, horizontal and vertical root mean square error, location description and photographs as indicated in the Monument Information Report (**Appendix 1**).

### **Phase Two: Beach Profiles**

Upon completion of the control reconnaissance survey, beach/upland and nearshore operations were initiated. Cross-sections of the beach in the project area were surveyed using extended rod RTK GPS rovers, and standard RTK GPS rovers. Extended rod RTK GPS rovers were used to augment RTK GPS survey capability into the nearshore. The current systems allow surveyors from APTIM to collect the entire beach profile with RTK GPS technology. Incorporation of RTK GPS into monitoring surveys greatly reduces the potential for human error during data collection and reduction.

Profiles commenced from the onshore control point and extend seaward overlapping the offshore data. Nearshore portions of the profiles were surveyed by two (2) surveyors with an extended rod & Trimble R8 or R10 RTK GPS rover who entered the water wearing personal floatation devices (PFD). Trimble TSC3 data collectors are equipped with Bluetooth technology allowing wireless communication with the GPS receiver at a data exchange speed of 2.1 megabits per second. The rover system allows surveyors from APTIM to reach a maximum water depth of eleven (11) feet. The nearshore survey extended seaward to a point overlapping the offshore portion of the profiles by at least fifty (50) feet.

The upland portion of the survey commenced at the waterline and extended 250 feet landward of the dune or until an obstacle was encountered. The upland portions of the profiles were surveyed using an RTK GPS. Elevations were taken at approximately twenty-five (25) foot intervals along each profile line and at all grade breaks. To maintain online accuracy surveyors utilized the RTK GPS feature *stakeout point*. *Stakeout point* allows surveyors to maintain the profile azimuth without relying on survey lathe or conventional compass bearings.

### **Phase Three: Nearshore/Offshore Profiles**

The Nearshore/Offshore profiles were conducted at each required profile station. Profile data was collected to a minimum of 3,000 feet beyond the shoreline and the -30 NAVD88 contour. The landward limits of the nearshore profiles were based on a minimum overlap of fifty (50) feet beyond the seaward extent of beach profiles. Soundings were collected at 200kHz with

an Odom Hydrotrac II single frequency sounder connected to a centrally located, hull-mounted transducer on APTIM's twenty-eight (28) foot Parker survey vessel. These soundings were then reduced to 25' spacing, sufficient to provide an accurate depiction of the seafloor.

Data was digitally stored using HYPACK 2021 Software. A Trimble R-8 RTK GPS and a TSS DMS-25 dynamic motion sensor were used onboard the survey vessel to provide instantaneous tide corrections and attitude corrections. Manual tide readings were taken while conducting the onshore portion of the profile to verify onboard tide readings. In order to maintain the vessel navigation along the profile lines, HYPACK 2021 navigation software was used. This software provided horizontal position to the sounding data allowing real-time review of the data in plan view or cross-section format. HYPACK 2021 also provided navigation to the helm to minimize deviation from the online azimuth.

Horizontal and vertical positioning checks were conducted at the beginning and end of each day as described in phase one (1) of the survey. The sounder was calibrated via bar-checks and a sound velocity probe at the beginning and end of the day. The DIGIBAR PRO sound velocity meter offers a fast additional calibration for sound velocity as compared to the traditional bar-check. Bar-checks were performed from a depth of five (5) feet to a depth of at least twenty-five (25) feet. Analog data showing the results of the bar-check calibration was displayed on the sounder charts at five (5) foot increments during descent of the bar. Offshore data was collected within two (2) weeks of onshore data collection for each line.

#### **Phase Four: Data Reduction/Submittals**

Upon completion of the field work, data was edited and reduced with Trimble Business Center, HYPACK 2021, and APTIM's proprietary software programs. The upland and nearshore portions of the beach profile were viewed and edited in Trimble Business Center and a comma delimited XYZ file was created. The offshore raw digital data was viewed and edited in HYPACK 2021's *Single Beam Editor*. The offshore RTK GPS tide data that was collected was compared to the manually collected RTK GPS nearshore tide data, local observed, and predicted tides for data verification purposes. Tide corrected offshore data was exported and a comma delimited XYZ file was created. All overlapping profile data was compared in cross section to ensure system accuracy. The edited beach profile data and offshore profile data were merged and a representative cross-section was derived for each profile line. The cross sections were developed using proprietary APTIM plotting programs.

The final plots were edited and reviewed with comparisons to previous years; discrepancies were noted and resolved. The final approved cross-section data was prepared in the required formats for submittal (**Appendix 3**). Digital data is provided in the State required vertical datum NAVD88.

Data Acquisition Report*

---

### **Map Preparation:**

Upon completion of the surveys and data reduction, the survey maps were prepared in ArcGIS 10.7.1. In order to avoid congestion, the survey maps do not show all of collected elevations but enough to give an accurate depiction of the cross sections. The survey charts display profile data and control monument locations plotted against Esri's background aerial imagery from July 2020. (Source: Esri, DigitalGlobe, GeoEye, i-cubed, USDA FSA, USGS, AEX, Getmapping, Aerogrid, IGN, IGP, swisstopo, and the GIS User Community).

### **Ground Digital Photography:**

Surveyors from APTIM collected three (3) digital photos at a mid-beach location at each profile location. The three (3) photos included one (1) in each shore-parallel direction and one (1) landward toward the monument. Wherever possible, an additional digital photo was taken of the control identification or stamping on the monument.

MATCHLINE SHEET 5 OF 27

MATCHLINE SHEET 7 OF 27

Atlantic Ocean

A graphic scale bar and a north arrow. The scale bar is labeled '0' on the left, '250' in the middle, and '500' on the right. Below the scale bar is the text 'GRAPHIC SCALE IN FEET'. To the right of the scale bar is a north arrow pointing upwards, with the word 'N' next to it. Below the north arrow is the word 'GRID'.

**NOTES:**

1. DATES OF SURVEY: JUNE 3, 2021 THROUGH JUNE 8, 2021.
  2. COORDINATES ARE IN U.S. SURVEY FEET BASED ON THE NORTH CAROLINA STATE PLANE COORDINATE SYSTEM, NORTH AMERICAN DATUM (NAD) 1983(2011).
  3. ELEVATIONS ARE BASED ON THE NORTH AMERICAN VERTICAL DATUM (NAVD) 1988 GEOID 18.
  4. DATE OF AERIAL PHOTOGRAPHY: JULY 22, 2020.

2021 Currituck County Topographic and Hydrographic  
Data Acquisition Report

---

### Survey Report Notes

**Survey Title:** 2021 Currituck County Topographic and Hydrographic Data Acquisition Report

**Prepared Date:** September 2021

**Prepared For:** Coastal Protection Engineering of North Carolina, Inc.

**Prepared By:** Aptim Environmental & Infrastructure, LLC

**Dates of Survey:** June 01, 2021 through June 08, 2021

**Survey Location:** Currituck County (C-001 through C-120)

---

**Notes:**

1. The survey is neither valid nor complete without both the survey report and described survey maps. Digital data files encompassing the following have also been provided in the following formats listed.
  - *Monument Information Report (Appendix 1)*
  - *ASCII file (profile xyz data. Digital only) (Appendix 2)*
  - *Profile Plots (Appendix 3)*
  - *Ground Digital Photography (Appendix 4)*
  - *Project field books (Digital Only)(Appendix 5)*
2. The information on this map represents the results of the survey on the dates indicated and can only be considered as indicating the general conditions existing at the time.
3. The coordinates shown are in US survey feet based on the vertical and horizontal data that was collected and presented relative to the North American Vertical Datum of 1988 (NAVD88) and the North Carolina State Plane Coordinate System, North American Datum of 1983(2011) (NAD 83(2011)).
4. Vertical measurements are based on second order monuments CAFFEY, RIDE, RUN, ADRIATIC, Q 261, and RADIO, per published NGS coordinates.

---

---

*2021 Currituck County Topographic and Hydrographic  
Data Acquisition Report*

---

5. Bearings are based on a bearing of North 17° 11' 42" West between NGS second order monuments CAFFEY and ADRIATIC per published NGS coordinates.
6. Underground and subaqueous improvements and/or utilities were not located as part of this survey and should be field verified prior to any dredging or construction activities.
7. Refer to APTIM field book No. 518 & NC field book No. 252 for the nearshore and onshore segments and book No. 66 for the offshore segments.
8. Aids to navigation were not located during this survey.
9. Soundings were collected using an Odom Hydrotrac II, Single Frequency, survey grade sounder. The sounder was calibrated prior to the start of the survey following manufacturers recommended procedures.
10. This survey was conducted for Currituck County for use as a topographic and hydrographic survey.

## **APPENDIX OVERVIEW**

### **1) Monument Information Report**

Data collected during the survey is entered in a spreadsheet format and compared to data provided by NGS. This comparison shows differences in northings, eastings and elevation of NGS published control, what was collected in the field, and what was used during profile reduction.

### **2) Profile XYZ data (digital only)**

Offshore survey data was converted into APTIM files. Onshore data was reduced by standard means of reduction and also entered into APTIM format and merged with the offshore data. APTIM format is used for in-house plotting, volume computations and other engineering analyses. The APTIM formatted data was converted into xyz format. The xyz data is provided in the datum collected (NAVD88) as per state standards.

### **3) Profile Plots**

Profile plots of this survey data compared with historical profile data.

### **4) Ground Digital Photography**

APTIM surveyors collected three (3) digital photos at a mid-beach location at each profile location. The three (3) photos included one (1) in each shore-parallel direction and one (1) landward toward the monument. In addition, wherever possible a digital photo was taken of the control identification or stamping on the monument.

### **5) Field Book Pages (digital only)**

This appendix includes copies of the field book pages used for the survey. Refer to APTIM field book No. 518 & NC field book No. 252 for the nearshore and onshore segments and navigation field book No. 66 for the offshore survey.

DATA ACQUISITION REPORT  
JUNE 2021**

**DATUMS: NAD83(2011) / NAVD1988 (U.S. SURVEY FEET)**

<b>Designation</b>	CAFFEY
<b>Stamping</b>	CAFFEY 1935
<b>Northing</b>	915308.87
<b>Easting</b>	2952084.11
<b>Horizontal Root Mean Square Error</b>	0.24
<b>Elevation</b>	1.99
<b>Vertical Root Mean Square Error</b>	0.10
<b>Description</b>	Station is about 350ft W of Caffey Inlet Coast Guard Station, on a small sand neck which extends into the marsh on the E shore of Currituck Sound. This neck is just S of an old can buoy lying in the marsh and is just N of a small gut which the road crosses on a small bridge. The station is about 225ft W of a flagpole at the fence line W of the coast guard station, a point in line with the S fence, and 179ft NW of the center of the bridge.

Monument: CAFFEY
